

Subject: The Backyard Baseball Lab is a wholly owned subsidiary of Zag Sports, Inc. As a function of its income generating activities the BBL leases its technology and equipment to third party facilities and teams.

Objective: Test the set up and calibration of the Trackman for the live game environment allowing the BBL to expand rental opportunities.

Considerations:

- Trackman, Tablet, Bracket, Tape Measure are in the bag
- <https://trackmanbaseball.zendesk.com/hc/en-us/categories/5101927222939-B1-Portable-Unit>
- <https://m.youtube.com/watch?v=Kvt9CQ37ZjA>
- Document each step and any learnings
- You will need to experiment with height. I dearly it's reachable by standing reach(or on a bucket)
- If you get it calibrated take a picture, measure exact distances and mark with athletic tape for future placement
- Trackman support said this:Using the pitching can operate at 20 feet but need more trial and error to calibrate the device beyond the recommended 13 feet for Pitching.
- If you happen to get it calibrated we can talk about whether or not we want to leave it up.

Trial 1 of Trackman

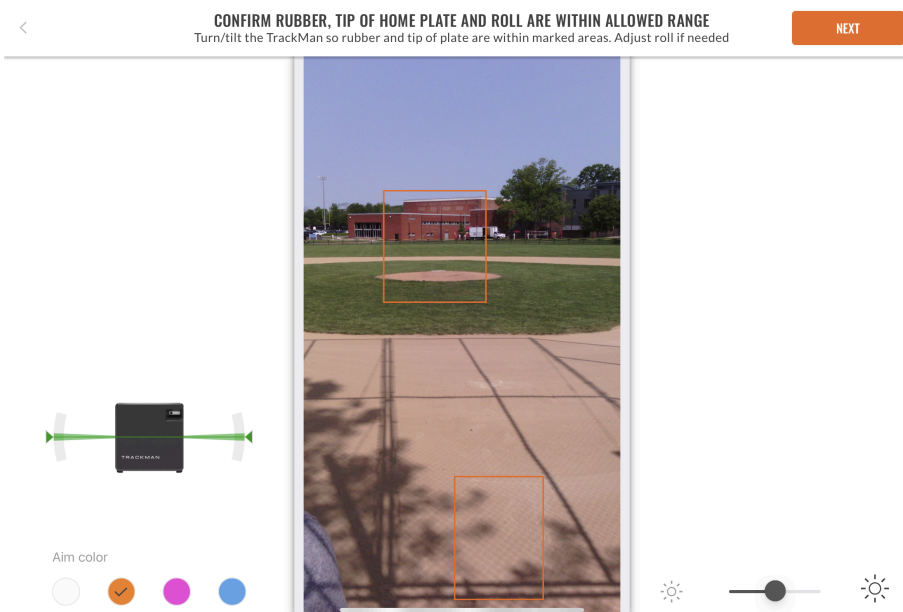

- Tried to set up the Bracket Pole Mount for VESA(100 x 100mm)
- The VESA plate did not fit into the back of the trackman
 - The VESA plate is a square while the trackman needs more of a rectangular plate for it to screw together
- Decided to instead use my hands and put it up there to see if the trackman were to work if the plate were to work and we did clamp it up at the desired location(height/distance)

Measurements

- First measurement was done from home plate, measured 266 inches / 22 feet 2 inches from the plate to the backstop
- Then measured from the backstop to 2½ feet right, then put white athletic tape of the fencing to mark it for next time
- Then measured up 8 feet from the ground and marked it with white athletic tape.

Conclusion

- The rubber and home plate were not in range, started messing around with the different distances and height and the range was just wider, that was the closest I could get it to

- As you can see the rubber is in range of the orange circle, but the plate is quite far from the range of the trackman(given by the orange circle). Changing the height and distance would just create a wider distance vertically from one another, and changing the offset(lateral distance) would just bring the rubber and plate further apart from each other horizontally.
